v3.0 Saving item-box state
a note created by glenn mcdonald on 1 Apr 98

Instinctive

The item box will include a small button (placement and pixels TBD), which will appear if you have the right to edit the page, that can be clicked to save the current size, view mode, column widths and sorting of this particular item box as its new defaults. These details are actually properties of the item that contains the item box, just like its name, type, etc., and control the initial state of the item box when any member opens that page. Any member can manipulate an item box after it appears, of course, just as in previous versions, but unsaved manipulations are local to the member making them, and persist only during this browser session. All item boxes are independent; changing the setting of a box in one item does not affect boxes in other items. Setting are carried over in a copy, export/import, move, etc.
